# Answer1:

Here we are using CIFAR-10 dataset to develop a CNN classification network to recognize RGB color images.

For the 1<sup>st</sup> task: mode = "small" -- 3 CONV layers

#### **Network Architecture:**

- 1. Input size is 3 x 128 x 128 (Transformations is resized to 128 x 128)
- 2. First 2D convolutional layer, taking in 3 input channel (image), outputting 32 convolutional features, with a square kernel size of 3, stride 1 and padding 1

$$= 128 \times 128 \times 32$$

- 3. Apply RELU for convolution
- 4. Max pooling of 2\*2

$$= 64 \times 64 \times 32$$

- 5. Second 2D convolutional layer, taking in 32 input channel (image), outputting 64 convolutional features, with a square kernel size of 3, stride 1 and padding 1
  - $= 64 \times 64 \times 64$
- 6. Apply RELU for convolution
- 7. Max pooling of 2\*2

$$= 32 \times 32 \times 64$$

8. Third 2D convolutional layer, taking in 64 input channel (image), outputting 128 convolutional features, with a square kernel size of 3, stride 1 and padding 1

$$= 32 \times 32 \times 128$$

- 9. Apply RELU for convolution
- 10. Max pooling of 2\*2

11. Using AdaptiveAveragePool to specify the recommended output size to 4 x 4

$$= 4 \times 4 \times 128$$

- 12. Flatten (4 x 4 x 128)
- 13. Fully Connected 1<sup>st</sup> layers with input neurons = 2048 (4  $\times$  4  $\times$  128) and hidden neurons = 2048
- 14. And then apply RELU Activation function for linear layers
- 15. Apply dropout with a rate of 0.5
- 16. Fully Connected 2<sup>nd</sup> layers with input neurons = 2048 and hidden neurons = 512
- 17. And then apply RELU Activation function for linear layers
- 18. Apply dropout with a rate of 0.5

- 19. Lastly, FC is used as output for 10 class predictions with input neurons = 512 and output neurons = 10
- 20. Training parameters used
  - a. RELU activation function
  - b. SGD is used as an optimizer
  - c. Learning rate of 0.001
  - d. 30 epochs
  - e. Mini-batch size of 10
  - f. Dropout 0.5
  - g. Cross-entropy loss

### Results:

Accuracy got of 71.07

For the 2<sup>nd</sup> task: mode = "large" -- 5 CONV layers

#### **Network Architecture:**

- 1. Input size is 3 x 128 x 128 (Transformations is resized to 128 x 128)
- First 2D convolutional layer, taking in 3 input channel (image), outputting 32 convolutional features, with a square kernel size of 3, stride 1 and padding 1

- 3. Apply RELU for convolution
- 4. Max pooling of 2\*2

$$= 64 \times 64 \times 32$$

5. Second 2D convolutional layer, taking in 32 input channel (image), outputting 64 convolutional features, with a square kernel size of 3, stride 1 and padding 1

$$= 64 \times 64 \times 64$$

- 6. Apply RELU for convolution
- 7. Max pooling of 2\*2

8. Third 2D convolutional layer, taking in 64 input channel (image), outputting 128 convolutional features, with a square kernel size of 3, stride 1 and padding 1

- 9. Apply RELU for convolution
- 10. Max pooling of 2\*2

$$= 16 \times 16 \times 128$$

11. Fourth 2D convolutional layer, taking in 128 input channel (image), outputting 256 convolutional features, with a square kernel size of 3, stride 1 and padding 1

- 12. Apply RELU for convolution
- 13. Max pooling of 2\*2

$$= 8 \times 8 \times 256$$

14. Fifth 2D convolutional layer, taking in 256 input channel (image), outputting 256 convolutional features, with a square kernel size of 3, stride 1 and padding 1

$$= 8 \times 8 \times 256$$

- 15. Apply RELU for convolution
- 16. Max pooling of 2\*2

$$= 4 \times 4 \times 256$$

17. Using AdaptiveAveragePool to specify the recommended output size to 4 x 4

$$= 4 \times 4 \times 256$$

- 18. Flatten (4 x 4 x 256)
- 19. Fully Connected 1<sup>st</sup> layers with input neurons = 4096 (4 x 4 x 256)and hidden neurons = 2048
- 20. And then apply RELU Activation function for linear layers
- 21. Apply dropout with a rate of 0.5
- 22. Fully Connected 2<sup>nd</sup> layers with input neurons = 2048 and hidden neurons = 512
- 23. And then apply RELU Activation function for linear layers
- 24. Apply dropout with a rate of 0.5
- 25. Lastly, FC is used as output for 10 class predictions with input neurons = 512 and output neurons = 10
- 26. Training parameters used
  - a. RELU activation function
  - b. SGD is used as an optimizer
  - c. Learning rate of 0.001
  - d. 30 epochs
  - e. Mini-batch size of 10
  - f. Dropout 0.5
  - g. Cross-entropy loss

### Results:

Accuracy got of **79.15** 

## Observations:

Accuracy got increased by 8.08 in 2<sup>nd</sup> task when we increased the number of convolution layers by 2.

CIFAR10 is a very large dataset.

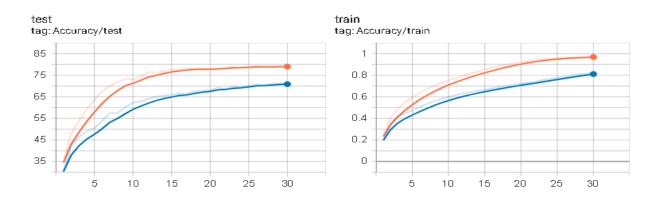

So, when we increase more layers, it helps in extracting more features from our input CIFAR10 dataset which results in increase of accuracy.

# **TensorBoard Analysis:**

Here, we can see all the different variations of both the model (small and large) architecture that we trained. Each model is denoted by separate color.

### **Test Accuracy Graph:**

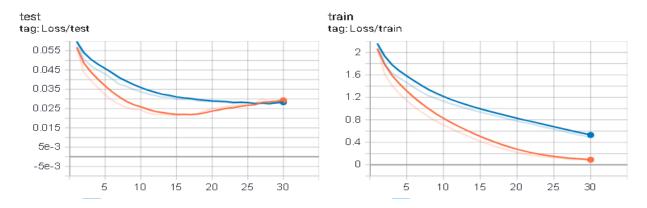

# Train Accuracy Graph:

Observations: Initially, the accuracy increases but after a while it becomes constant with small variations.

### Test Loss Graph:

# Train Loss Graph:

Observations: Loss initially drops, and after a while it becomes almost constant and slowly starts to rise as the model slowly starts overfitting.
